

MINISTRY OF AGRICULTURE HYDROMETEOROLOGICAL SERVICE

WEATHER BRIEF for Sunday, April 16, 2017 from the Hydrometeorological Service, Guyana

Rainfall records for the past 24 hours, measured at 08:00 hrs Sunday April 16, 2017, were available for most of the stations.

The highest rainfall of 32.7 mm was recorded at Parishara in Region 9.

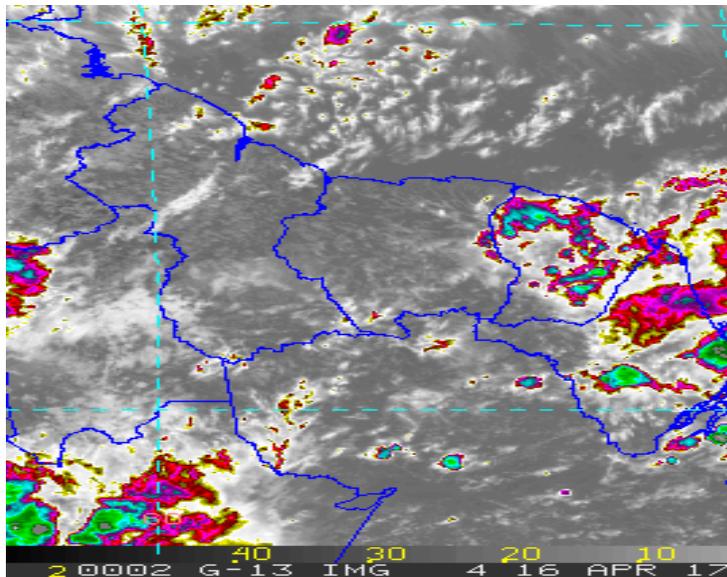

Synopsis: Ridge of high pressure remains the dominant feature affecting most of Guyana. Upper level influences remains unfavourable with the shift in orientation of the Upper level trough.

Today's weather review: Overcast skies with brief passing morning showers became sunny across Guyana.

Table # 1 Weather forecast for the next Twenty-four hours.

Sunday April 16, 2017 (19:00 hrs – 07:00 hrs)			Monday April 17, 2017 (07:00 hrs – 19:00 hrs)		
Regions	Weather Conditions		Regions	Weather Conditions	
Regions 1 to 10	 No significant rainfall.	Partly cloudy to cloudy skies can be expected throughout Guyana with the likelihood of a few brief passing showers in some coastal areas during the late evening into early morning. Winds: Breezy Minimum temperatures: Coast: 23 °C – 26°C Hinterland: 18 °C – 20 °C	Regions 1 to 10	 Rainfall between: 20.0 mm and 50.0 mm (0.79 to 1.97 inch) in Regions 6 and 9. Elsewhere, no significant rainfall	Regions 9 and southern Region 6 will see overcast skies with intermittent rain showers and possible thundershowers. All other regions will see sunny skies with a few cloudy spells and possible light passing showers. Winds: Breezy to windy Maximum temperatures: Coast: 31 °C – 34°C Hinterland: 28 °C – 30 °C

The long-term daily average rainfall for Georgetown, for the next 10 days, April 16 to April 25, 2017 is 5.2 mm per day.

Infra-red Satellite image valid 19:15 UTC (15:15 hrs) Sunday April 16, 2017

Table # 2 Occurrences of high and low tides for the next 24 hours and the times for sunrise and sunset.

Tonight (April 16,2017)	Tomorrow Morning (April 17, 2017)	Tomorrow Afternoon (April 17, 2017)
High Tide 19:14hrs Height 2.50m	Low Tide 01:03hrs Height 1.20m High Tide 07:23hrs Height 2.41m	Low Tide 14:01hrs Height 1.00m
Sunrise	05:43hrs	Sunset
		18:00hrs

Sea conditions: MODERATE SEAS WITH WAVES REACHING HEIGHTS OF 1.5 TO 2.0 METERS IN OPEN WATERS

Extended Forecast

Tuesday thru Saturday, sunny skies will be observed throughout Guyana with a few cloudy spells and early morning passing showers. Rainfall is expected between 0.0 mm to 10.0 mm (0 – 0.39 inch) within 24 hours.

Our Mission: To Observe, archive and understand Guyana's weather, and Climate and provide meteorological, hydrological and oceanographic service in support of Guyana's national needs and international obligation.

Seasonal Information (UPDATED 13 March, 2017) – ENSO alert status: Not Active

ENSO-neutral conditions are favored to continue through at least the Northern Hemisphere spring 2017 (June), with increasing chances for El Niño development into the fall (September).

According to the ENSO update issued on Thursday March 9, 2017, by the Climate Prediction Centre and associates, ENSO neutral conditions continued throughout the month of February, 2017. This was reflected in near-average sea surface temperatures (SSTs) across the central equatorial Pacific and above-average SSTs in the eastern Pacific. The low-level easterly winds were slightly enhanced over the western tropical Pacific and were weaker than average over the eastern Pacific. Also, upper-level westerly winds were anomalously easterly over portions of the western and eastern Pacific. Most models predict the continuation of ENSO-neutral through the early Northern Hemisphere summer (May-July; Fig. 6). However, some dynamical model forecasts anticipate an onset of weak El Niño as soon as the late Northern Hemisphere spring (March-May 2017). Because of typically lower skill in forecasts made at this time of the year, and the lingering La Niña-like tropical convection patterns, the forecaster consensus favors ENSO-neutral conditions during the spring (March-May) with an approximately 75% chance. Thereafter, there are increasing odds for weak El Niño toward the second half of 2017 (50-55% chance from approximately July-December).

The latest CARICOF forecasts suggest that Guyana would experience above normal (35 % probability) to normal (35 % probability) weather conditions during the period March to May.

Surface analysis shows that the ITCZ is oscillating south of the equator and the subtropical High pressure is the most dominant feature in the Northern Atlantic. These and other dynamic and thermodynamic features in the atmosphere show that Northern Guyana is currently in its first dry season for the year, while Southern Guyana continues in its only dry season. Southern Guyana is expected to begin to transition into its only rainy season towards the end of March. Considering the present conditions and forecast conditions, Guyana is likely to experience above normal to normal weather conditions during the next three months. Please note that the dry season does not imply the absence of precipitation, but a reduction of precipitation.

Update in the bulletin is provided daily by the Hydromet Service: www.hydromet.gov.gy
