WEATHER BRIEF for today Monday, 25 May 2026, from the Hydrometeorological Service, Guyana

Rainfall records for the past 24 hours, measured at 08:00 hrs Monday, May 25, 2026, were available for most stations.

Annai in Region 9 recorded the highest rainfall of 87.3 mm.

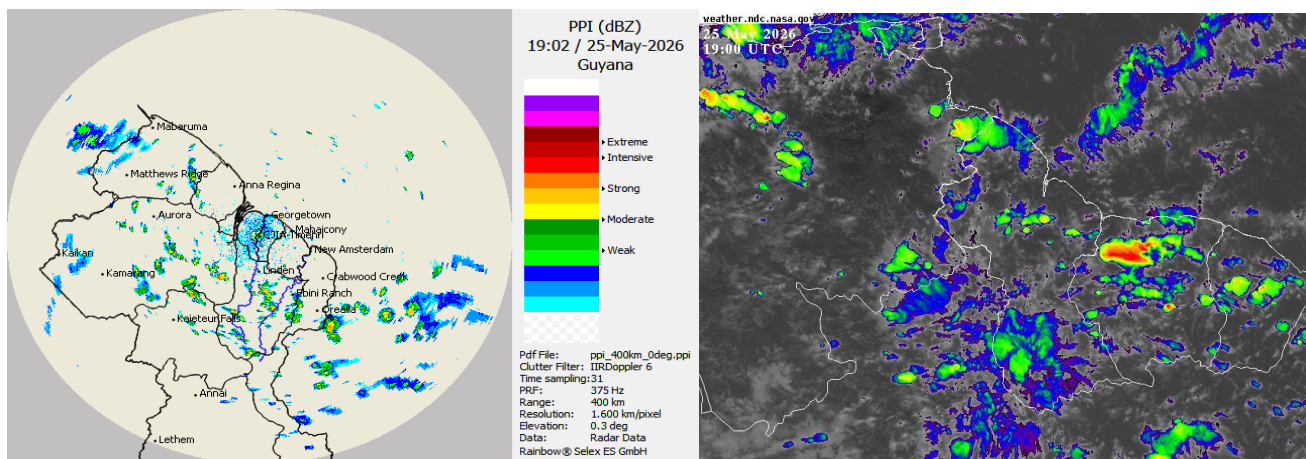

Severe Weather Warnings: Soils may already be saturated from continuous and heavy rainfall, and any rainfall amounts can increase the likelihood and exacerbation of flooding in areas over Southern Guyana. Hilly areas can also expect possible mudslides during heavy downpours. In areas of thundershowers, heavy winds and lightning strikes may be observed. Persons are asked to be alert and exercise caution in efforts to safeguard life and property.

Synopsis: Dry air from the 700 mb and 500 mb levels is creating stable conditions over Guyana throughout the morning period. However, localized conditions and diurnal heating produced mild to moderate instabilities over Inland areas during the afternoon. Southern Guyana continued to be influenced by low-level forcings, which produced and will continue to produce mild to moderate convection. This is expected to continue for the remainder of the week. Tropical wave # 6 is expected to affect areas over Northern Guyana from Friday morning and continue for the remainder of the week. Convection behind the axis will likely result in clouds with significant vertical extent.

Today's weather review: Cloudy skies with isolated to scattered showers were observed over Inland and Southern Guyana.

Monday, 25 May 2026 (19:00 hrs – 07:00 hrs)			Tuesday, 26 May 2026 (07:00 hrs – 19:00 hrs)		
Regions	Weather Conditions		Regions	Weather Conditions	
Coastal Guyana	 HAZIE No significant rainfall.	Partly cloudy to fair and hazy skies are likely to continue over Coastal Guyana. Cloudy to overcast skies with scattered to frequent showers of varying intensities, and continuous rain can be expected in Inland and Southern Guyana. <u>Winds:</u> Gentle to moderate easterly to south-easterly breeze.
